EE24BTECH11036 - Krishna Patil

Question: Solve the differential equation given below with initial conditions $x = 1$ and $y = e$.

$$y \ln y \, dx - x \, dy = 0 \quad (1)$$

1) **Rearranging the Equation:** First, we rewrite the equation in a more convenient form:

$$y \ln y \, dx = x \, dy \quad (2)$$

Next, we divide both sides by $x \ln(y)$:

$$\frac{dy}{dx} = \frac{y \ln y}{x} \quad (3)$$

2) **Separation of Variables:** Now, we separate the variables to prepare for integration:

$$\frac{dy}{y \ln y} = \frac{dx}{x} \quad (4)$$

3) **Integration:** We now integrate both sides.

$$u = \ln y \implies du = \frac{1}{y} dy \quad (5)$$

$$\therefore \int \frac{1}{u} du = \int \frac{1}{x} dx \quad (6)$$

This leads to:

$$\ln |u| = \ln |x| + C \quad (7)$$

Substituting $u = \ln y$, we have:

$$\ln |\ln y| = \ln |x| + C \quad (8)$$

Exponentiating both sides:

$$|\ln y| = e^C |x| \quad (9)$$

Let $C' = e^C$, so:

$$|\ln y| = C' |x| \quad (10)$$

Now solving for $\ln y$, we get:

$$\ln y = C' x \quad (11)$$

Exponentiating again:

$$y = e^{C' x} \quad (12)$$

- 4) **Applying the Initial Conditions:** To determine the constant C' , we apply the initial condition $x = 1$ and $y = e$:

$$e = e^{C' \cdot 1} \quad (13)$$

Thus, $C' = 1$, and the solution to the differential equation is:

$$y = e^x \quad (14)$$

- 5) **CODING LOGIC:** The solution for the differential equation can be graphically solved using coding by using below logic :

$$x_0 = 1 \quad (15)$$

$$y_0 = e \quad (16)$$

$$h = 0.1 \quad (17)$$

$$y_{n+1} = y_n + h \cdot \left(\frac{y_n \ln y_n}{x_n} \right) \quad (18)$$

$$x_{n+1} = x_n + h \quad (19)$$

Below is verification 5 :
